Data Center Energy Health Check

Know what changed in your data centre's energy use, when, and what it costs.

The problem

EU data centres must report their energy efficiency every year. A yearly number shows **that** something changed, but not **what**, **when** or **how much it costs**.

The service

1 Learn
how much energy the site normally needs, from the meters it already has

→

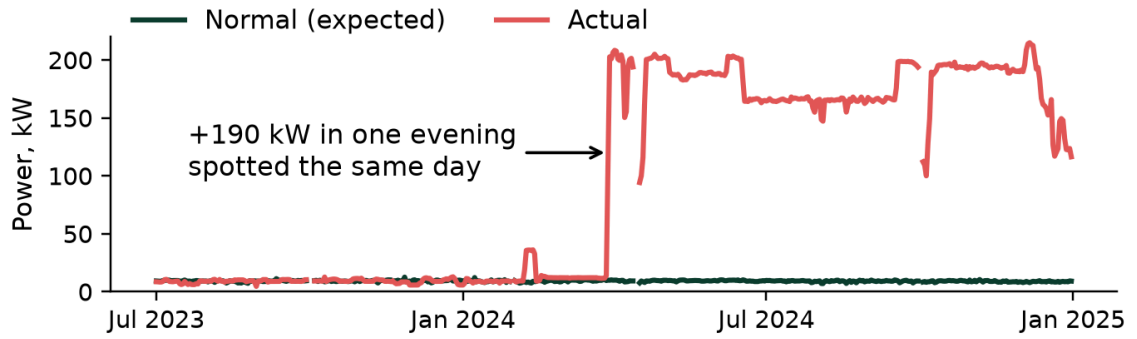

2 Spot
any change, the same day it happens

→

3 Price
each change in euros: keep it, or fix it?

Real example

Open data from a US supercomputing centre (NREL). Air-handling power, normal vs actual:

Mar 2024
Our service: **same day**

May 2025
Yearly report: **14 months later**

€130,000

per year: the cost of that single change

Who it is for

Data-centre operators who have meters, but no time to analyse them.
